Dear CelebriOS hiring team,

I am writing about the Product Manager role for your mid-market analytics platform. My interest is direct: I have spent the better part of a decade owning analytics and data platform products in B2B environments, and the work you describe, discovery through launch, tight engineering partnership, evidence-based prioritisation, is the model I default to rather than aspire to.

At the Bundesagentur für Arbeit I owned the national labour-market analytics platform used by policymakers and researchers. I instrumented the data pipeline, introduced Dagster and dbt so quarterly indicator imports ran without hand-holding, and migrated the system from bare metal into containers, all while carrying a full UI relaunch and serving as Deputy IT Security Officer. At Rohde & Schwarz I inherited an AI data platform where rollout took days and could not carry a hotfix; I introduced GitOps delivery with ArgoCD and brought rollout time to 30 minutes. Both engagements required me to define what success looked like before investing engineering effort, and to redirect the product when the data said otherwise, including, at Rohde & Schwarz, killing a UI-led design that recorded zero real clicks in favour of a developer-code-first approach that people actually used.

Your posting asks for someone who can say no when evidence does not support an idea. I have done this consistently: at CLINET Platforms I cut a three-person team's roadmap to the top 10% of features, and user acceptance rose more than fivefold. At EMIL Group I restructured an 18-person delivery organisation into three lean teams after diagnosing that sprawl, not effort, was the root cause of attrition and missed trust with clients. Prioritisation and trade-off communication are not skills I practise on the side; they are the core of how I run a product area.

On the analytics and data dimension specifically: I have owned ETL pipeline design, KPI definition, and funnel analysis as product artefacts, not as adjacent activities handed off to data engineers. This means I can have a genuine conversation with your data team about what is feasible, and a genuine conversation with your mid-market customers about what is useful, without needing a translator in either direction.

I would welcome the chance to discuss the role and the specific product area in more detail.

Best regards, *Philipp Hilbert*
