Dear Hiring Team,

I am writing to apply for the AI Product Manager position in Abu Dhabi. Abu Dhabi is one of my primary target locations and I am prepared to relocate and work fully on-site, so the geography is a positive rather than a compromise.

The role description is unusually honest about what it actually requires: not a PM who has read about AI, but one who can assess technical feasibility, shape AI-native product experiences, and manage the trust of government and enterprise clients simultaneously. That combination is what I have been doing for the past several years, first at Rohde & Schwarz on a defence AI platform for the FCAS programme, then at Bundesagentur für Arbeit on a national labour-market analytics system, and through my own company across healthcare, insurance, and security products.

At Rohde & Schwarz I inherited a platform whose rollout took days and could not carry a hotfix. I introduced GitOps delivery with ArgoCD across a multinational team: rollout time fell to thirty minutes. More importantly, I pushed to instrument two competing product directions against real user behaviour. The UI-led approach recorded zero clicks. I redirected the product accordingly. That is the kind of decision this role requires, using data and direct customer contact to override assumptions, then executing cleanly across engineering and design. At EMIL Group I shipped the Claims Center from concept to production with no precedent, cutting time-to-market for a new insurance product from many months to less than a week, after restructuring an eighteen-person delivery organisation that had been losing its senior engineers.

On the AI side, I build and use multi-agent workflows daily. I have designed agentic systems for autonomous delivery, built evaluation loops with human-in-the-loop checkpoints, and applied LLM tooling across discovery, prototyping, and backlog generation. My github.com/hilbertp repository includes a self-built multi-agent coding framework I use as production infrastructure. I know where LLMs are genuinely useful in a product workflow and where they introduce latency or risk, which matters when advising government clients on AI adoption.

Abu Dhabi's focus on AI-powered enterprise and government products at speed is exactly the environment where structured product thinking and AI fluency compound. I would welcome the opportunity to discuss fit.

Best regards, *Philipp Hilbert*
